It is described a method for controlling a transmission of messages for a signalling procedure between a base station and a user equipment via a radio transmission channel. The method comprises generating at least one message for the signalling procedure, wherein the at least one message comprises signalling procedure information and indicates control information being indicative for the presence of at least one subsequent message for the signalling procedure and/or for resources of the radio transmission channel being allocated to the at least one subsequent message, transmitting the at least one message between the base station and the user equipment, and controlling the transmission of the at least one subsequent message between the base station and the user equipment based on the control information.
